

Indications & Dose - Suppression of inflammatory and allergic disorders

- ▶ Administered by deep intra-muscular injection
- ▶ 40mg deep intra muscular injection administered into the gluteal muscle
- ▶ (top outer quadrant) **The deltoid muscle should not be used due to the risk of fat atrophy**
- Lay patient in the prone position
- Locate the great trochanter
- Find the top of the iliac crest
- Draw an imaginary line between the top of the iliac crest and the great trochanter
- The site for injection is above that line, do not inject below this line as the sciatic nerve lies in this region
- Ensure that the injection site is clean and the skin intact
- Inject at a 90 degree angle, aspirate ensuring no blood is drawn, inject slowly.
- Withdraw the needle and press the site firmly with a gauze
