

Preparing Hyalase® For Use

- Once the desired volume has been chosen add 1ml of the diluent to the opened ampoule of Hyalase®
- Ensure that the powder is fully dissolved, draw up the contents a couple of times and place back and forth into the ampoule to ensure this is the case.
- Withdraw the 1ml volume of reconstituted Hyalase® and add this to the remaining diluent.
- Agitate by gently rolling the ampoule in between the palms of the hands to ensure that the Hyalase® is evenly distributed throughout.
- The reconstituted solution can be drawn up into a syringe and injected where needed.
- The number of units can be calculated by:

Volume to inject (ml) = $\frac{\text{Number of units required (units)}}{\text{Volume of diluent (ml)}}$ x

Total number of units (1500 units)
