

Hyalase® (Hyaluronidase) Injection Aftercare

Keep this aftercare leaflet safe and present if necessary to treating physician

Hyalase®, is an enzyme which breaks down hyaluronic acid fillers, but it can also break down naturally occurring hyaluronic acid present in the body. The results can be unpredictable and the effect dramatic. I understand that there will be loss of volume and there can be some skin laxity which may not give a good aesthetic result. Although some of the effects can be immediate, I understand that it can take up to seven days for the results to be realised and the procedure may need to be repeated.

Important notes 24 – 36 hours post treatment:

Hyalase™ administration can result in anaphylaxis a severe allergic reaction which is life threatening and requires immediate medical attention. Symptoms of a severe allergic reaction can include shortness of breath, wheezing, coughing, difficulty swallowing, swelling of the tongue, eyelids, lips, hoarseness of the voice, stomach pain, nausea or diarrhea.

If you have any of the above symptoms, please report to your nearest Accident and Emergency Department or call 999 for an ambulance.

After the treatment some other common injection-related reactions might occur. These reactions include redness, swelling, pain, itching, bruising and tenderness at the injection site. They have generally been described as mild to moderate and typically resolve spontaneously a few days after injection. Bruising may occasionally be more significant.

***If you have any concerns following treatment do not
hesitate to contact us***

I have been treated with Hyalase® (Hyaluronidase, 1500u reconstituted with 10mls of water for injection) to dissolve a hyaluronic acid dermal filler. A skin patch test of 0.02ml was administered to the left/right (delete as appropriate) forearm. No sign of an allergic reaction was noted, and the procedure undertaken. Following injection, I was monitored for 30 minutes within the clinic.
